

NREL Phase VI Wind turbine modeling using ANSYS CFD

Dr.Ing. Răzvan MAHU
Prof.Dr.Ing. Florin POPESCU
Prof.Dr.Ing. Ion Ion

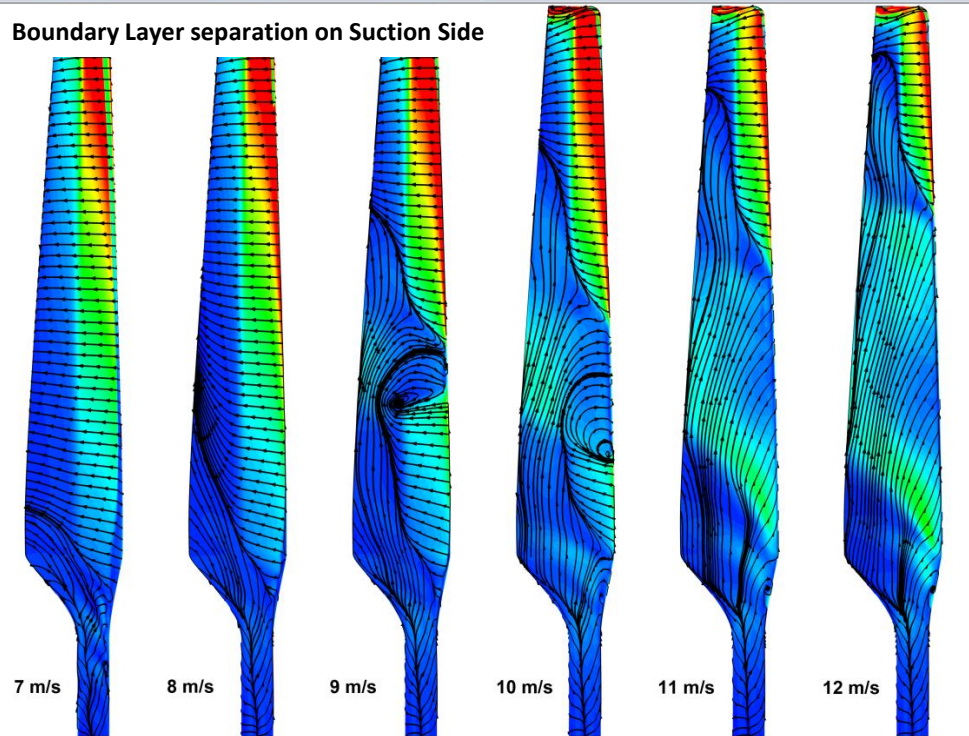

NREL Phase VI Wind Turbine

Rotor diam.: 10.058 m
Rot. speed: 71.63 RPM
Nom. power: 19.8 kW

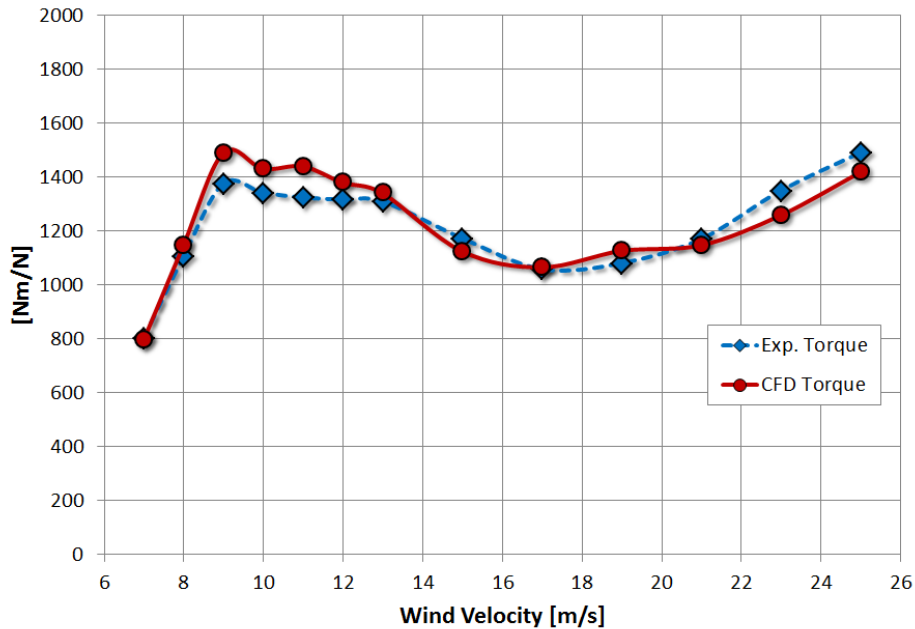

Boundary Layer separation on Suction Side

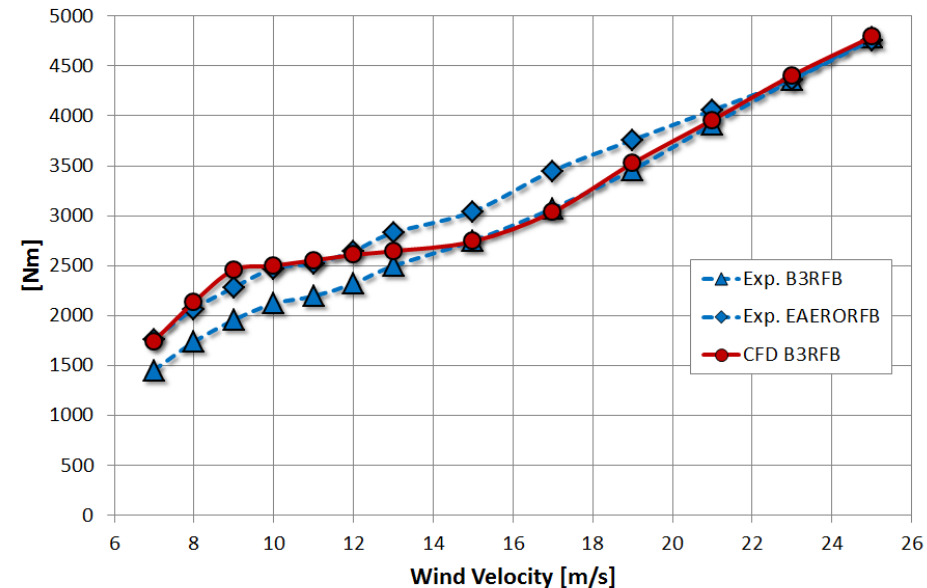

NREL Phase VI Wind Turbine (2)

CFD Results vs. Experimental Data : Rotor Torque

- Very good assessment of Turbine Power and Blade Bending Load over entire Wind Speed range
- Excellent prediction of turbine passive control mechanism action (BL stall)

CFD Results vs. Experimental Data : Blade Root Flap Bending Moment

Biomass-Fueled Boiler

- Forced convection, batch-fueled two-stage small boiler, burning briquette-shaped biomass mixtures
- A highly complex, UDF implemented biomass thermal decomposition model converts biomass components into char, tar and gases used as input for the CFD combustion model
